Scientific History

By George Canguilheim

Introduction

What Sirohi calls with Alain Badiou and Althusser – formalization and even Greek history and scientific structure is actually and in fact a history of sciences and their equations and such advanced sciences as biology, physics and mathematics – but there is also the history of material culture called history of in my sense structuralism and science – I am identical to Sirohi and Badiou, even mode of production debates from Althusser – but the small difference is I am only about that

side and such lectures – thank you for improving scientific consciousness in the Marxist sense of Soviet Union. I am told we have no sense of science by all the discussions with them. Hope to be more advanced in the debate.

I. History is about Practices and Several Practices and this then is actually Levels

I argue that practices in a topo-graph is actually levels.

II. Levels then are scientific

I mean this then is scientific levels in a practice – imagine cooking practices in a house – it has a level of science in it which is the stove.

Part II.

Imagine then scientific history – it will develop the level, practice and scientific history of cooking perhaps but also labouring and even scientific experimentation in simple classes in physics in a school – these Greek images are scientific history – the rest is politics.
